A NOVEL ADJUVANT CAPABLE OF SPECIFICALLY ACTIVATING THE ADAPTIVE IMMUNE RESPONSE

5 Abstract

A composition for eliciting an immune response to an immunogen comprises an immunogen in combination with a mast cell membrane activator such as compound 48/80. Any suitable immunogen may be employed, such as an antibody-inducing determinant, a lipid, a peptide (e.g., an antibody-inducing peptide), a carbohydrate, an immunogen derived from a virus or cancer cell, etc. Methods of use are also described.
